Corro Pump® has been established in South Africa since 1985. The core business of the company is the design, manufacture and marketing of corrosion resistant pumps. In 1988 the decision was taken to relocate to larger premises in Vanderbijlpark, where there is a high concentration of company's manufacturing and using aggressive chemicals.

By the end of 1993 our manufacturing records indicated that there were some 878 Corro pumps working throughout South Africa. In 1994 we commenced with exporting to New Zealand and Australia, such was the demand for Corro Pumps.

In 1994 vertical spindle pumps were added to our existing Horizontal pump range. By 1995 we were starting to receive enquiries for much larger pumps than we could manufacture with our existing equipment and it was therefore decided to build a new factory and install larger ovens, overhead cranes, mixers etc.

The new Corro pump® factory shown in the picture on the right was built and occupied early in 1996. This larger facility now enabled us to build a new larger range of pumps capable of delivering flow rates of up to 7003/hr and since then Corro pumps has added another model which now increases the flow rate capability to 1000m³/hr.

During 1996 a new model range called the "Mark II" was designed and built to improve on and supersede the old "Mark I" design.

This new Mark II design was built to target the overseas market where a standard electric motor can be used with our Close coupled pump configuration whereby no modification to the electric motor is required. (See picture on right) The Corro pump® range consists of more than 30 Horizontal close coupled and long coupled pump models. The Vertical spindle range of Corro pumps® also exceed 30 models with various spindle lengths. (see picture on right)

Corro pumps have since their inception in 1985 been marketed extensively throughout South Africa, Africa and more recently Asia, Australia, New Zealand and Norway. Corro pumps are well received by process engineers and are utilized at Gold mining plants, Uranium plants and Solvent extraction plants where various chemicals need to be pumped.

In our quest for pumping excellence Corro pumps have an inclusive range of pumps available for transferring different fluids such as solvents, seawater, effluents, light acidic slurries and waste products. It should also be noted that Corro Pumps are designed to be highly efficient, thereby utilizing minimal energy to optimize power required.

To date Corro pumps have manufactured well in excess of 5000 Corro pumps which are utilized in all types of industry and as a 100% South African manufactured product we hope you may consider Corro Pump Manufacturing for your Pump utilities in the future.
